

BASF focuses on high-performance cathode active materials (CAM) as the value-adding core of Li-ion battery cells

BASF Cathode Active Materials (CAM)

- Nickel-Cobalt-Manganese oxide (NCM)
- Nickel-Cobalt-Aluminum oxide (NCA)
- **CAM** chemistry determines the battery's **energy density** and has major impact on **weight, range** and **safety** of the battery
- CAM is being tailored to meet targets in **battery performance, lifespan** and **cost**
- BASF offers one of the **broadest CAM portfolios in the industry**
- **Global market leader** in **NCA: highest energy density CAM** for Electric Vehicle (EV) application
- Aim to offer CAM **based on recycled metals** from **a closed loop solution**
