

HED™ NCA and NCM Cathode Active Materials

HED™ product family includes a series of high energy density cathode active materials for lithium-ion batteries with a very high degree of purity, excellent product characteristics and proven abilities to support for the evolving requirements of batteries in automotive drivetrains.

Why BASF's HED™ NCA and NCM cathode active materials?

- Strong technology and intellectual property position
- Strong market presence for CAM production in all regions
- Developed in decades of collaboration with various strategic partners including customers and academia
- Benefits from a sustainable and responsible global supply chain
